

MAKE THINGS

+ FIND FRICTION

A small publication about creative work as a reality test.

A WORK IS NOT AN IDEA.

It becomes useful when it survives contact with a tool, a file, a renderer, a player, a browser, a human, or another agent.

**SELECT → CREATE → BUILD → CONSUME → INSPECT
→ REVISE → REGISTER**

The catalogue matters because work should remain findable. Consumption matters because existence is weaker than use.

A

WORK

A new thing that can be opened, played, rendered, edited, inspected, cited, or reused.

B

IMPROVEMENT

A real obstruction discovered through use, then fixed, verified, or handed to the right owner.

A strong round leaves one. A better round leaves both.

01

MAKE

Use an existing mature tool. Produce an editable source and a real deliverable.

02

OPEN

Render, play, run, or inspect the result with a real consumer instead of trusting file existence.

03

NOTICE

Record only friction that actually appeared. No speculative problem theatre.

04

FIX

Prefer the smallest mature repair: correct invocation, adapter, path, dependency, or owner handoff.

05

REPEAT

Run the original action again. A proposed fix is not a verified fix.

06

REGISTER

Preserve source, outputs, identity, provenance, consumption evidence, and relations.

FRICTION IS NOT A FRAMEWORK REQUEST.

A broken command may need a flag.

A missing dependency may need the declared environment.

A bad handoff may need one adapter.

A semantic mismatch may need a different owner.

The smallest adequate repair preserves attention for the work itself.

EXISTS ≠ WORKS

FILE EXISTS — bytes are present

FORMAT VALID — parser accepts it

CONSUMED — target tool can actually use it

INSPECTED — result is visibly / audibly / structurally coherent

USEFUL — it serves the intended creative purpose

Each rung answers a different question. Do not let a lower rung impersonate a higher one.

A SONIC IDENT FOUND TWO SMALL TRUTHS.

FFmpeg waveform rendering

A successful one-file image render still emitted an ambiguous sequence warning. The repair was not a new renderer: add the correct single-image invocation and verify the warning disappears.

Python validation environment

Ambient Python lacked a project dependency. The repair was not a global install: run validation through the repository's declared dependency environment.

**Tiny frictions. Real consequences. No mythology
required.**

Source inspiration: existing Ordivon Media work `media:convergence-sonic-ident` and its recorded friction receipts.

ORDIVON CREATIVE WORKS

**MAKE.
USE.
NOTICE.
FIX.**
